

MINECRAFT CTF

"Only the one who masters Linux
can defeat the Ender Dragon."

1. Overworld Discover

The world generates events in real-time. Open a second terminal and monitor the global server log to keep track of changes:

```
tail -f /var/log/minecraft_server.log
```

Mineshafts hold many secrets. Map out hidden structures inside the project directory and filter out empty decoy files:

```
ls -la  
find . -type f -size +0c
```

1. Loot Analysis

Your scan has revealed hidden assets across the shafts. Here is what they truly represent:

1. `.hidden_crevice/golden_apple.txt` - A golden apple artifact hiding your first secret flag. Read it:

```
cat east-shaft/.hidden_crevice/  
golden_apple.txt
```

2. `.lost_library/secret_room/book_of_wisdom.py` - An ancient book of the old sage. Put it in your universal inventory (the `/tmp` directory) to carry it across dimensions and decode runes later:

```
cp .lost_library/secret_room/  
book_of_wisdom.py /tmp/
```

3. `north-shaft/flooded_section/mysterious_gem.png` - A raw gem resource disguised with a fake extension. Inspect its type:

```
file north-shaft/flooded_section/  
mysterious_gem.png
```

It is actually a pure text file! Read its core content to claim your second hidden flag:

```
cat north-shaft/flooded_section/  
mysterious_gem.png
```

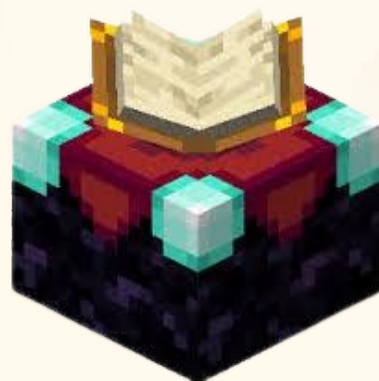

2. Archive Search

Now find your path to the Nether. Breach the secret library room and analyze the massive server logs to filter out noisy messages and find administrative errors!

```
grep "ERROR" ./lost_library/  
server_logs.txt
```

The logs mention an old world backup stored away in the dark. Locate the compressed archive file inside the old mineshaft and extract it:

```
tar -xzf world_backup_2011.tar.gz
```

2. Ancient Diary

The world backup archive is now successfully unpacked. Navigate into the temporary folder and extract the final records from the recovered miner's diary:

```
cat world_backup/miners_diary.txt
```

3. Light the Way

Locate the pitch black secret mine path. You cannot see anything here. Craft a working torch by writing the active power keyword into the file:

```
echo "light" > .abandoned_mineshaft/  
  .deep_cave/.secret_mine/torch.txt
```

The flame wakes up a guard! A dangerous zombie process spawns instantly to protect the cache. Delete its file to terminate the threat:

```
rm .abandoned_mineshaft/.deep_cave/  
  .secret_mine/zombie.txt
```

The monster drops a chest on the ground. Read the parchment inside to uncover credentials for the next dimensions:

```
cat .abandoned_mineshaft/.deep_cave/  
  .secret_mine/chest.txt
```

4. Nether Stash

Cross the dimensional border. Use your credentials to log in as the nether traveler session user:

```
su nether_traveler  
Password: MinecraftCTF{portal_ignited}
```

Track the footprints of the previous traveler. Inspect the shell environment execution history log to leak their emergency stash code:

```
cat ~/.bash_history
```

5. Enchanting

Go to the nether folder and inspect the ancient text on the enchanting table. It holds three base64 runtime ciphers:

```
cat nether/enchanting_table.txt
```

Use the book of wisdom Python script from your universal inventory to pass and decode the true name of the Sharpness V rune:

```
python3 /tmp/book_of_wisdom.py  
"U2hhcnBuZXNzIFY="
```

Cast the spell by writing the decoded enchantment directly into your combat file setup:

```
echo "Sharpness V" > nether/  
enchanted_sword.txt
```

6. Wither Battle

Before you advance, complete the altar ritual. Move the skull item file into the active altar directory to open the gates:

```
mv nether/wither_skull.txt  
nether/altar_of_fire/
```

Enter the fortress zone. The boss has a 000 file system shield. Break its immunity settings and destroy it completely:

```
cd nether/wither_fortress/  
chmod 777 wither_boss.txt  
rm wither_boss.txt
```

7. The End Portal

Collect the nether star drop file. Now establish a secure remote network shell tunnel to jump straight into the end dimension framework:

```
ssh ender_traveler@localhost
Password:
MinecraftCTF{dragon_slayer}
```

The portal path is silent. Schedule your arrival time at 12:00 in the user cron table to trigger the portal event. Add this exact line at the bottom of the file:

```
crontab -e
0 12 * * * /bin/true
```

The dragon is protected by a background service. Locate the systemd daemon and stop it completely:

```
systemctl stop ctf-spawner.service
```

8. Freeing the End

With the spawners down, you must now slay the remaining protective endermen guards. Use a wildcard to purge all text entities, then destroy the main core dragon directory tree to finish the run!

```
rm the_end/*.txt  
rm -rf the_end/ender_dragon
```
